

Home data vs mobile data

Understanding how mobile and home internet connections are different can help you save money.

How is home data different from mobile data?

Most people have two different and separate internet connections:

- A home data connection, which everyone at home can share.
- A mobile data connection, which is just for your mobile phone when you are out and about.

The data for your home internet connection and mobile internet connection comes from different places.

- Your home internet data comes through your home's router and is shared by all the devices in your home.
- Mobile internet data comes to your phone through a nearby mobile phone tower. Your mobile internet data is used only by your mobile phone.
- You will have a separate data allowance for your mobile phone and home internet. Even if an internet service provider bundles your home internet and mobile phone into a single bill, the data allowance for each will appear separately.

Home and mobile data come from different places

How much data for your money?

A mobile data plan usually has a much lower data allowance than a home internet plan. While each provider charges slightly differently, here's a general estimate of how much data you can expect for your money.

Home data allowance

- \$50 per month: 500GB
- \$100 per month: unlimited

Mobile data allowance

- \$50 per month: 10–15GB
- \$100 per month: 40–100GB

Mobile data plans provide less data than home internet plans

Home data vs mobile data

Which of my devices uses which kind of data?

The two kinds of data – home internet and mobile data – are used by different devices. Here's a list of common devices that use each type of data.

Home internet data

Devices usually intended to stay in your home all the time use home internet, including:

- Desktop PCs
- Laptops
- Smart TVs
- Tablets
- Wireless speakers
- Security cameras

Many common devices can connect to Wi-Fi

‘Devices usually intended to stay in your home all the time use home internet.’

Mobile data

Devices usually intended to go out and about use mobile data, including:

- Mobile phones (or smartphones)
- Some laptop computers
- Some tablets
- Some smartwatches
- Some medical alert devices

Home data vs mobile data

Home and mobile data

Some devices can use home internet and mobile data, however. Those devices can be set up to automatically switch to whichever signal is strongest so that you can stay connected to the internet wherever you are. These devices include:

- Mobile phones (or smartphones)
- Some laptop computers
- Some tablets

Most mobile devices can use mobile data and Wi-Fi

Using Wi-Fi to save mobile data

Setting your phone up to connect to your home Wi-Fi whenever you are at home is a good way to save money on your mobile data plan. Mobile data is much more expensive than home data and using your home Wi-Fi saves your mobile data for when you are out and about.

To set up your mobile phone to use your home Wi-Fi, there are a few basic steps:

- Enable Wi-Fi in your phone settings.
- Search for your home **Wi-Fi** name in the list of networks and select it. The first time you do this, you will be prompted to enter the password. This **password** is usually located on the bottom of the router or on a special card provided by your home internet service supplier.
- From then on, each time you come home, the phone will connect to the Wi-Fi automatically.

Connecting your mobile to Wi-Fi when at home helps save money on mobile data
